

Question 2 You are designing a poster which prints out numbers with a unique style applied to each of them. The styling is based on the number of closed paths or holes present in a given number. Marked out of 5.00 The number of holes that each of the digits from 0 to 9 have are equal to the number of closed paths in the digit. Their values are: F Flag question 1, 2, 3, 5, and 7 = 0 holes. 0, 4, 6, and 9 = 1 hole. 8 = 2 holes. Given a number, you must determine the sum of the number of holes for all of its digits. For example, the number 819 has 3 holes. Complete the program, it must must return an integer denoting the total number of holes in num. Constraints 1 ≤ num ≤ 109 Input Format For Custom Testing There is one line of text containing a single integer num, the value to process. Sample Input Sample Output Explanation Add the holes count for each digit, 6, 3 and 0. Return 1 + 0 + 1 = 2. Sample Case 1 Sample Input Sample Output Explanation Add the holes count for each digit, 1, 2, 8, 8. Return 0 + 0 + 2 + 2 = 4.

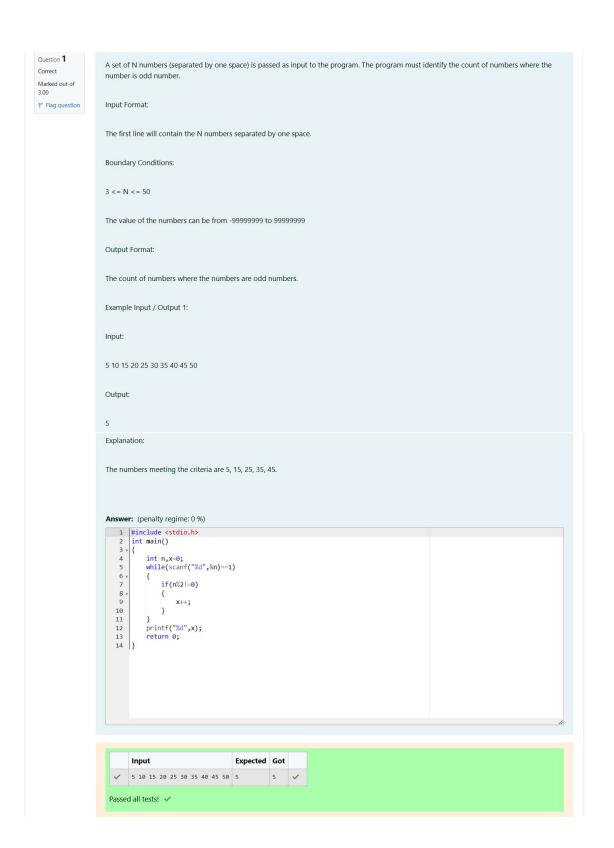

Answer: (penalty regime: 0 %)

```
#include <stdio.h>
                            int main()
                        2
3
4
5
                                int a,b,n;
scanf("%d",&a);
while(a>0)
                                     b=a%10;
if(b==0||b==6||b==9||b==4)
                       10
11
                                         n+=1;
                       12
13
                                     }
else if(b==8)
                       14
15
                                         n+=2;
                       16
                       17
                                     a=a/10;
                       18
19
                                printf("%d",n);
                       20
                            Input Expected Got
                          630 2

Question 3
                    The problem solvers have found a new Island for coding and named it as Philaland. These smart people were given a task to make a purchase
                    of items at the Island easier by distributing various coins with different values. Manish has come up with a solution that if we make coins
Marked out of
                    category starting from $1 till the maximum price of the item present on Island, then we can purchase any item easily. He added the following
                    example to prove his point.
Flag question
                    Let's suppose the maximum price of an item is 5$ then we can make coins of {$1, $2, $3, $4, $5}to purchase any item ranging from $1 till $5.
                    Now Manisha, being a keen observer suggested that we could actually minimize the number of coins required and gave following distribution
                    ($1, $2, $3}. According to him any item can be purchased one time ranging from $1 to $5. Everyone was impressed with both of them. Your task
                    is to help Manisha come up with a minimum number of denominations for any arbitrary max price in Philaland.
                    Input Format
                    Contains an integer N denoting the maximum price of the item present on Philaland.
                    Output Format
                    Print a single line denoting the minimum number of denominations of coins required.
                    Constraints
                    1<=T<=100
                    1<=N<=5000
```

Correct

Question 2 Given a number N, return true if and only if it is a confusing number, which satisfies the following condition: Marked out of 5.00 We can rotate digits by 180 degrees to form new digits. When 0, 1, 6, 8, 9 are rotated 180 degrees, they become 0, 1, 9, 8, 6 respectively. When ▼ Flag question 2, 3, 4, 5 and 7 are rotated 180 degrees, they become invalid. A confusing number is a number that when rotated 180 degrees becomes a different number with each digit valid. Example 1: 6 -> 9 Input: 6 Output: true Explanation: We get 9 after rotating 6, 9 is a valid number and 9!=6. Example 2: 89 -> 68 Input: 89 Output: true Explanation: We get 68 after rotating 89, 86 is a valid number and 86!=89. Example 3: 11 -> 11 Input: 11 Output: false Explanation: We get 11 after rotating 11, 11 is a valid number but the value remains the same, thus 11 is not a confusing number. 1. 0 <= N <= 10^9 2. After the rotation we can ignore leading zeros, for example if after rotation we have 0008 then this number is considered as just 8. Answer: (penalty regime: 0 %) 1 |#include <stdio.h> 2 int main()
3 * { int n,x,y=1;
scanf("%d",&n);
while(n!=0 && y==1) n=n/10; if(x==2 || x==4 ||x==7) 11 y++; 12 13 14 15 }
if(y==1)
printf("true");
else 16 17 printf("false");
return 0; 18 19 Input Expected Got true true 89 true true false false 🗸 Passed all tests! 🗸

Question **3**Correct
Marked out of 7.00

F Flag question

A nutritionist is labeling all the best power foods in the market. Every food item arranged in a single line, will have a value beginning from 1 and increasing by 1 for each, until all items have a value associated with them. An item's value is the same as the number of macronutrients it has. For example, food item with value 1 has 1 macronutrient, food item with value 2 has 2 macronutrients, and incrementing in this fashion.

The nutritionist has to recommend the best combination to patients, i.e. maximum total of macronutrients. However, the nutritionist must avoid prescribing a particular sum of macronutrients (an 'unhealthy' number), and this sum is known. The nutritionist chooses food items in the increasing order of their value. Compute the highest total of macronutrients that can be prescribed to a patient, without the sum matching the given 'unhealthy' number.

Here's an illustration:

Given 4 food items (hence value: 1,2,3 and 4), and the unhealthy sum being 6 macronutrients, on choosing items 1, 2, 3 -> the sum is 6, which matches the 'unhealthy' sum. Hence, one of the three needs to be skipped. Thus, the best combination is from among:

- · 2 + 3 + 4 = 9
- . 1 + 3 + 4 = 8
- . 1+2+4=7

Since 2 + 3 + 4 = 9, allows for maximum number of macronutrients, 9 is the right answer.

Complete the code in the editor below. It must return an integer that represents the maximum total of macronutrients, modulo 1000000007 $(10^9 + 7)$.

It has the following:

n: an integer that denotes the number of food items

k: an integer that denotes the unhealthy number

Constraints

- $1 \le n \le 2 \times 10^9$
- $1 \le k \le 4 \times 10^{15}$

Input Format For Custom Testing

The first line contains an integer, *n*, that denotes the number of food items.

The second line contains an integer, k, that denotes the unhealthy number.

Sample Input 0

2

Sample Output 0

3

Explanation 0

The following sequence of n = 2 food items:

- 1. Item 1 has 1 macronutrients.
- 2. 1 + 2 = 3; observe that this is the max total, and having avoided having exactly k = 2 macronutrients.
